

Ketchup Clinic Mentor Check-In:12/05

Agenda:

1. Demo of MVP and explaining each view
2. Updated view of calendar to only show pill times. We discussed how showing other stuff distracted the user from what we were trying to show.
3. Missed milestones for MVP
 - a. CSRF
4. Question: How advanced should the UI be? For us it took - it took a ton of time to get the algorithm working.

Progress Report:

Recent Milestones Completed

1. Database integration complete
2. Updated Algo to use new data model
3. Added feature on Activities to allow user to remove any added event
4. Added feature on Activities to add default events to a user (easy for testing and getting started)
5. UI overhaul underway - significant progress made
6. Using database to track UI flags
7. User is not logged out on refresh

Incomplete:

1. Error checking for activities page
2. CSRF not being mitigated

Difficulties that were Overcome:

1. Updating the Algo to work with database.

We had to update the input handling of the algorithm because previously we were using an array that was passed in, since we had no database. This took a lot of time (mostly on the testing) side to ensure everything still worked optimally.

2. Added Events View on Activities Page

This is a very complicated view for the application. We spent a ton a time to figure out how to effectively store events for each day such that the user can easily see what was added. We also offer the ability to remove each event.
