Summary:

We first demoed our MVP to our mentor for about the first 15 minutes. We went through view explaining what changes had been made and why. In parallel, we showed the TA an example of creating a drug schedule, so we added sample information and created a sample drug regimen. Once a schedule was generated, we discussed how we changed our plans from showing a calendar to showing a daily itinerary, since our core focus is less about being a calendar and more about being a system to tell you when to take your meds. We concluded the meeting with general questions about deadlines and a short discussion on how we should continue to prioritize work on the core concept.

Advice/Changes:
- Prioritize UI development so the main aspect (seeing drug regimen) is well done
- UI needs to be flexible to handle resizing of browser window
- Still need to look into: api.use = middleware. Automatically goes to the appropriate route using next.
- Implement CSRF protection

Conclusion:

Overall after our discussion, the sentiment was positive because we are on track and our core concept is working.
